FEBRUARY 1991 OKLAHOMA SUMMARY

Preliminary results indicate that February 1991 was the fourth driest on record, and the driest since 1963. The western third of Oklahoma (Climate Divisions 1, 4 and 7) averaged less than 0.01 inch of precipitation for the month. The largest monthly total in the region was 0.05 inch, which fell on the 13th at the Wichita Mountain Wildlife Refuge. Central Oklahoma did not fare much better; CD's 2 and 5 both recorded less than 10% of normal precipitation. Only southeast Oklahoma (CD 9) had more than 25% of normal precipitation. The statewide average of 0.26 inch was 1.22 inches below normal. The dry conditions placed further stress on winter wheat crops, which already had been suffering from a dry January. Grasslands also dried out, raising the potential for fires across much of the state. Strong winds helped to spread the flames of many such fires.

The lack of moisture also allowed the air to warm quickly, increasing daily temperature ranges. The heat of the afternoon sun frequently pushed maximum temperatures into the 70's, especially across western Oklahoma. The statewide-average temperature of 48.3 degrees was 6.3 degrees above normal, making this the fifth warmest February on record. February's warmth also balanced the cold from December 1990, contributing to a near-normal average temperature for Winter 1990-1991. The overall average was 39.6 degrees. The dry start to 1991 dropped the state-averaged winter precipitation to 0.74 inch below normal, with a meager total of 3.64 inches for the winter.

The first two weeks of February were generally warm and dry, with highs ranging from the 50's to the 70's statewide. A frontal passage on the 5th had little effect on temperatures, but brought the heaviest rainfall of the month to southern and eastern Oklahoma. Rainfall in excess of one inch was recorded at Hugo (1.51 inch) and Broken Bow (1.46 inch) on the 5th and Healdton (1.08 inch) on the 6th. No other stations reported rainfall over an inch for the remainder of the month.

The warmth continued beyond the frontal passage, as maximum temperatures reached into the upper 70's across western Oklahoma on the 12th and 13th. The low temperature of 65 degrees at Hugo on the 13th was their warmest minimum temperature recorded in February since 1948.

A cold front put a chill on Valentine's Day, as lows dropped into the teens and 20's while maximum temperatures were held to the 30's. The cold did not last long however. A warm front, which passed through the state on the 17th, sent temperatures soaring to the 70's and low 80's. Carnegie set a record high temperature of 82 degrees on the 17th, and Altus was only one degree shy of their 83 degree record for the date.

Temperatures remained mild until another cold front cleared the state on the 24th. Maximum temperatures behind the front fell to the 30's and 40's across northern Oklahoma. The front also brought a surprise snowfall to many residents of northeastern Oklahoma. Up to six inches of snow fell in Miami and Tulsa reported 1.5 inch. The snow quickly melted as temperatures warmed again. By the end of the month, maximum temperatures had climbed back into the 60's and 70's statewide.

Mark A. Shafer

February 1991 percent of normal precipitation.

April wind roses for Oklahoma City and Tulsa for 10-year (1965-1974) mean winds (data adapted from NOAA Airport Climatology Series). Percents represent the percentages for winds coming from a direction. The numbers at the end of the bars indicate the average speed (miles per hour) of winds from that direction.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$29 \sum_{i=1} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

CLIMATE CALENDAR

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1948-1988. Extremes are found for the period
 of record (1924-present).
