MONTHLY SUMMARY FOR OCTOBER 1993

A record setting cold wave during the last week of October put a major chill on Halloween trick-or-treating for the second time in three years. The cold air brought with it a rare October snowfall and a few reports of single-digit temperatures, including the all-time lowest temperature ever reported during October in the state's recorded history, 3 degrees above zero at Freedom on the morning of the 31st. The statewide average temperature of 58.1 degrees was 4 degrees below normal for the month, making this the coolest October since 1976 and the eighth coolest October, overall. The average temperature for the year-to-date is 62.1 degrees, 1.3 degrees below normal and the 10th lowest average since record keeping began in 1892.

Precipitation was slight over most of the state, averaging 1.78 inches, statewide. This October was the 30th driest on record with the total falling short of the normal value by 1.29 inches. Southeastern Oklahoma received some very heavy rains from the 15th through the 20th, resulting in some local flooding. As a result, monthly precipitation amounts in that region were generally above normal. Statewide average total precipitation for the year-to-date is 34.92 inches, 4.77 inches above normal. The first nine months of 1993 were the 20th wettest of the 102 comparable time periods on record for the state.

Pleasant autumn weather prevailed over the state most of the month. High temperatures in the 90s were reported several times, mainly in the west during the first eight days. Thunderstorms produced large hail in some areas of eastern Oklahoma on the evening of the 1st. Several locations reported in excess of an inch of precipitation, led by Fanshawe (LeFlore County) with an even two inches.

Another round of thunderstorms, preceding an advancing cold front, produced a possible tornado near Jay and another northeast of Tahlequah on the 8th. Reports of large hail were received from several counties in southern and eastern parts of the state. Broken Bow reported 2.24 inches of precipitation ending early on the 9th. Daily minimum temperatures at several reporting stations in northwestern Oklahoma were in the 20s and lower 30s on the 10th, 11th and 12th after passage of the front.

Thunderstorms produced large hail in south central and southwestern Oklahoma and in the Panhandle on the 12th. Roosevelt (Kiowa County) and Marietta (Love County) each reported 1.64 inches of precipitation. Daytime temperatures reached the upper 80s in southern Oklahoma from the 15th through the 18th, while thunderstorms in central Oklahoma on the 15th and eastern Oklahoma on the 16th produced large hail. Lyons (Adair County) reported 3.09 inches of precipitation on the 16th and the Tahlequah report from the 17th noted 2.44 inches.

Heavy rains in the southeast on the 18th, 19th and 20th produced flash flooding along the Glover River and other streams. Broken Bow reported precipitation on four consecutive days (17th through the 20th) totaling 10.14 inches, including a daily amount of 5.37 inches on the 20th. Hugo received 6.16 inches during the same period.

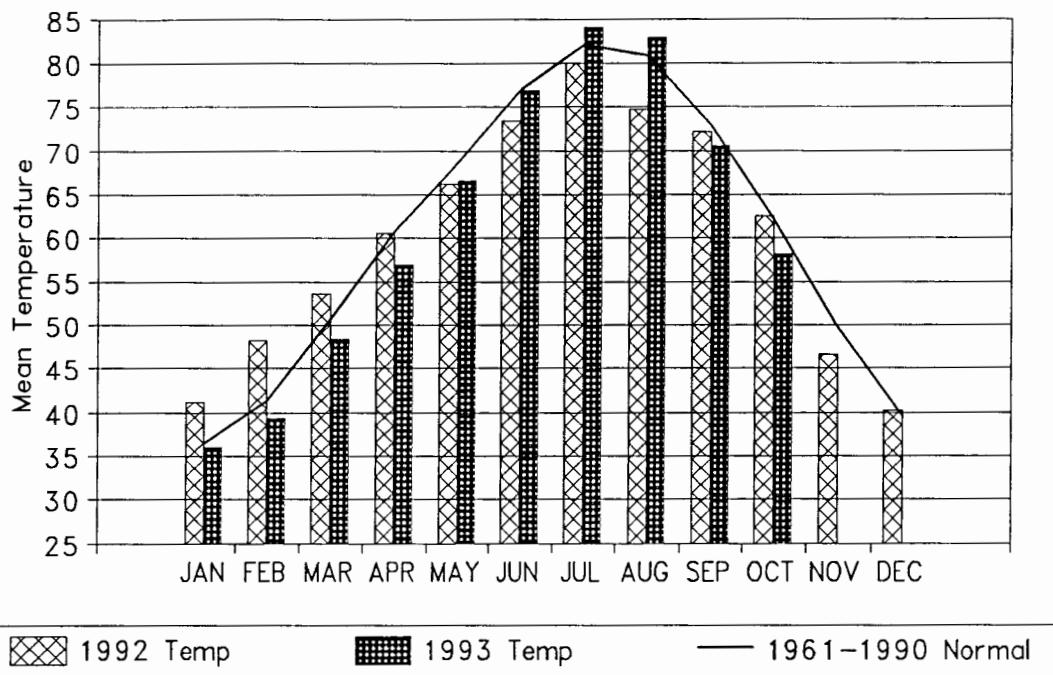

Cooler air prevailed during the remainder of the month as the state's lowest daily minimum temperatures, mostly in western Oklahoma, were in the 20s every day from the 21st to the end of the month. Kenton (Cimarron County) reported snow flurries on the 26th as daytime temperatures in the Panhandle climbed only to the low 40s.

The major outbreak of cold air ripped through the state on the 29th, producing a record October low temperature of 6 degrees and one and one-half inches of snow at Kenton. As the system moved further into the state, Kansas (Delaware County) reported 2 inches of snow and Tulsa received .3 inch of snow, the earliest measurable snowfall ever reported there. Snow, often mixed with sleet or rain, was reported as far south as Marietta and Kingston (Marshall County).

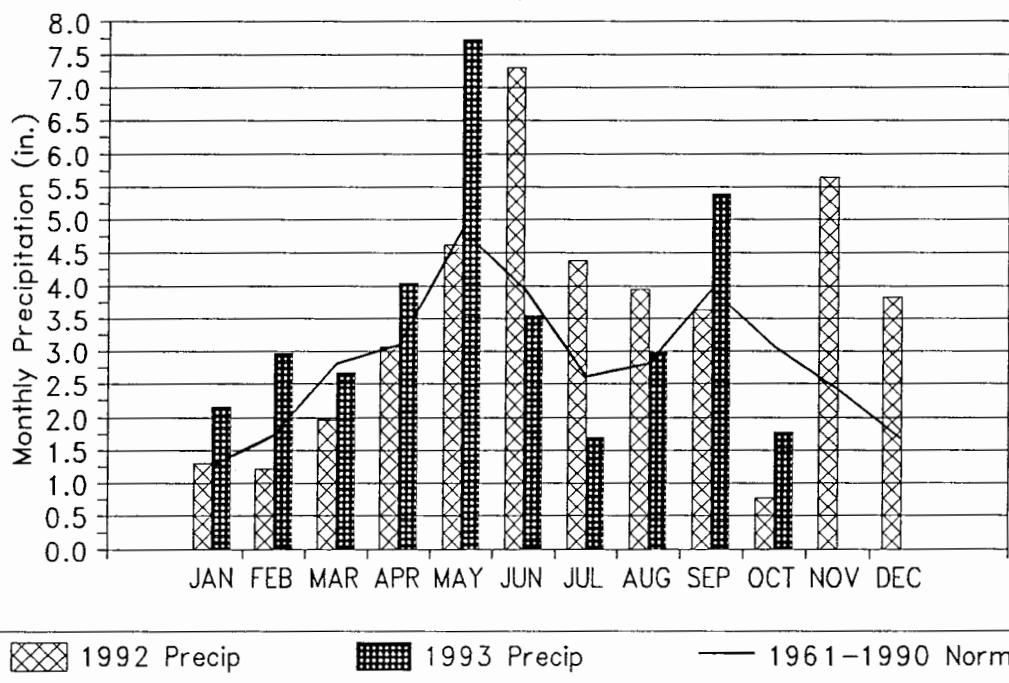

The temperature at Freedom (Woods County) on the morning of the 31st dropped to 3 degrees, breaking the state low temperature record for October that had been established only two days previously. Waynoka (Woods County) reported an 8 degree temperature the same day. The pre-1993 record for the state in October was 9 degrees at Hurley (Cimarron County) in 1917.

- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR

The data on this calendar are for Oklahoma City. Normal values are calculated for the period 1961-1990. Extremes are found for the period of record (1891-present).

December 1993

TULSA CLIMATE CALENDAR

The data on this calendar are for Tulsa. Normal values are calculated for the period 1948-1991. Temperature extremes are for the period 1905-1992; precipitation extremes are for the period 1948-1992.
