MONTHLY SUMMARY FOR AUGUST 1995

Flooding in northern and western Oklahoma during the first week of August gave way to monotonous heat and humidity for the remainder of the month. Precipitation in Oklahoma, when averaged across the state and accumulated through the month, was greater than normal, illustrating the occasionally misleading nature of statistical summaries. The statewide precipitation for the month, 3.08 inches, was 0.26 inch greater than normal, but much of the state received less than normal precipitation, and rainfall was sparse everywhere after the first three days in August. Daytime temperatures in the 100s prevailed during most of the month to produce a monthly average temperature of 82.5 degrees, 1.7 degrees greater than normal. Although elevated humidities and the general lack of day-to-day change made the heat seem especially oppressive, the monthly temperature ranks as only the 33rd highest August temperature in the state since 1892.

Although the summer season ended on a hot, dry note, the overall statistics for June, July and August indicate that it was a wet summer with near normal temperatures. Precipitation for the three months averaged 13.07 inches, 3.68 inches greater than normal, ranking this as the state's 14th wettest summer. The average temperature of 79.6 degrees is 0.4 degree below normal and is the 40th lowest summer temperature. Accumulative statistics reveal that the state-averaged precipitation for the first eight months of the year of 30.12 inches, 6.98 inches greater than normal, ranks 11th in the 104 years of record. The annual temperature, thus far, of 62.5 degrees is 0.1 degree above normal.

Moisture associated with the former tropical storm Dean moved into western Oklahoma at the first of the month and interacted with a stationary front to produce torrential precipitation in many areas of southwestern, west central and north central Oklahoma. A local deluge at Stillwater (Payne County) on the first (5.31 inches at the cooperative reporting station west of town but reportedly greater in the northern part of the city) produced widespread local flooding. Heavy rains the same day led to flooding along Sand Creek near Okesa in eastern Osage County. A more general set of floodgates opened on the second and third, extending along a 75-mile-wide band from the southwest corner of the state through Alfalfa and Grant counties in extreme northern Oklahoma. Unofficial measurements indicate that as much as 16 inches fell (near Hawley in western Grant County) through the morning reports on the 4th, by which time most of the precipitation had ended. Great Salt Plains Dam (Alfalfa) reported 12.07 inches, including a daily 6.74 inches reported on the morning of the 3rd. Approximately 10 inches fell at Cherokee (Alfalfa). Storm total amounts in excess of 8 inches, according to either National Weather Service Cooperative Observers or Oklahoma Mesonet automated rain gages were reported at Canton Dam (Blaine), Bessie (Washita), Putnam (Dewey), Clinton (Custer), Hollis (Harmon), Elk City (Beckham), Cheyenne (Roger Mills), Sayre (Beckham), Fairview (Major) and Thomas (Custer).

Street flooding was reported in Cherokee, Fairview and Blackwell (Kay). Flooding along the Salt Fork of the Arkansas inundated portions of Grant and Kay counties, including the community of Jefferson (Grant). Interstate 35 was closed west of Tonkawa (Kay) for 15 hours when floodwater from the Salt Fork covered the highway bridge and its approaches. Flooding along the Cimarron, Canadian and Washita rivers closed several highways in west central Oklahoma. Two people died in traffic accidents when automobiles in which they were riding hydroplaned during the heavy rain and collided with other vehicles. A 62-year-old man drowned when the car in which he was riding was swept off a spillway at Clinton Lake (Custer).

As the precipitation associated with Dean weakened, it was slowly replaced by a ridge of high pressure that, for the most part, minimized precipitation activity for the rest of the month. Thunderstorms across northern Oklahoma reached severe status on the 6th as winds estimated at 80 miles per hour struck Keetonville and Inola (both in Roger County). A possible tornado was reported north of Wagoner and wind damage was reported at Fort Gibson Lake (Wagoner). Some large hail was reported in Rogers County and damage from thunderstorm winds was reported in Woods, Alfalfa and Cherokee counties.

Although occasional thunderstorms produced an inch or more of precipitation at isolated locations during the remainder of the month, daytime temperatures in the 100s and overnight lows that frequently remained in the mid-to-upper 70s dominated the state weather for the remainder of the month. Temperatures reached at least 99 degrees somewhere in the state each day for the remainder of the month. The soil moisture from the flooding had a moderating effect on temperatures in the affected regions for several weeks afterwards, but other areas were not so fortunate. Seminole reported the highest temperature of the month (107 degrees) on the 30th, as the southeastern quarter of Oklahoma was most affected by the heat. Calvin (Hughes) reported no precipitation for the month and Durant (Bryan) and Coleman (Johnston) noted no precipitation after reports on the morning of the first.

- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:
- Station Identification Number: These are usually assigned by the National Climatic Data Center.
- Climate Division: See the figure above.
- Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1961-1990. Extremes are found for the period
 of record (1891 - present).
