MONTHLY SUMMARY FOR DECEMBER 1998

One of the strangest weather years in memory ended in rather pedestrian fashion as December 1998 rang out with slightly higher than normal temperature and precipitation. The statewide –averaged temperature of 40.6 degrees (1.1 degrees above normal) is the 51st highest December temperature in the 107 years for which such information is known. December's precipitation, averaged across the state was 1.89 inches (0.23 inches greater than normal) to rank the month as the 37th wettest December since 1892. Preliminary data indicate that 1998, with a statewide temperature of 62.3 degrees (2.1 degrees higher than normal), was the 10th warmest on record. Despite the drought that dominated large portions of the state during spring and summer, the year's annual precipitation of 36.60 inches was 2.36 inches greater than normal, making 1998 the state's 32nd wettest year since 1892.

Persistently mild weather dominated the early weeks of the month with Poteau (LeFlore County), Stilwell (Adair), and Broken Bow (McCurtain) all reporting daily maximum temperatures of 79 degrees on the 5th. Several southern and eastern Oklahoma sites collected more than two inches of rain, including 2.90 inches at Hugo (Choctaw), 2.36 inches at Daisy (Atoka), 2.33 inches at Clayton (Pushmataha) and 2.31 inches each at Marlow (Stephens) and at the Mesonet site near Broken Bow. An intrusion of cold air on the 8th brought snow and temperatures in the teens to the Panhandle and brought sub-freezing temperatures to Oklahoma City (Oklahoma) and Lawton (Comanche), establishing new records for the latest first freeze of autumn at both locations. Cimarron County snowfall reports included 4 inches at Regnier, 3.2 inches at Kenton, and 2 inches at Boise City. Hooker (Texas) also reported 2 inches of snow.

The last half of the month was notable for an outbreak of cold air during its third week that introduced sub-zero temperatures in some areas and treacherous freezing rain and drizzle in others. While some areas of the northwest reported light snow, including three inches at Fort Supply Dam (Woodward), 2.5 inches at Laverne (Harper) and Range (Texas), and two inches each at Kenton and Cherokee (Alfalfa), most areas of the state were subjected to freezing rain, drizzle, or fog on the 21st and again on the 23rd. Icy roadways led to five deaths in traffic accidents near Manitou (Tillman) and Atoka (Atoka). The temperature at the Kenton Mesonet site dropped to -8 on the 21st. Fort Supply Dam reported a low of -7 on the 21st and Boise City reported that same value on the 22nd. Mesonet data indicate that temperatures remained below freezing, statewide throughout the 22nd and 23rd with many areas not reaching 32 degrees again until Christmas Day. The recovery was rapid, however, as Kenton and the Boise City Mesonet site each recorded 70-degree temperatures on the 30th.

- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:**
- Station Identification Number:** These are usually assigned by the National Climatic Data Center.
- Climate Division:** See the figure above.
- Number of Temperature Observations:** These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal:** The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum:** The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum:** The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days:** HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN
FEBRUARY

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990.
 Temperature extremes are for the period 1891-1997.
 Precipitation extremes are for the period 1891-1997.
