## MONTHLY SUMMARY FOR AUGUST 2000

According to preliminary data from the National Weather Service, statewide-averaged precipitation this August was the least recorded for a warm-season month in Oklahoma in 109 years of record keeping. The state's rain gauges recorded an average precipitation of 0.16 inch (2.66 inches less than normal), breaking the previous record of 0.22 inch set in August 1936. Despite the August drought, both summertime and year-to-date precipitation remained greater-than-normal through the end of the month. Buoyed by a wet June, precipitation for the three summer months, when averaged across the state, totaled 9.98 inches, 0.59 inch greater than normal and the 51<sup>st</sup> largest summer total recorded since 1892. Year-to-date precipitation totaled 23.72 inches, 0.58 inch greater than normal, to rank this as Oklahoma's 49<sup>th</sup> wettest January-through-August.

As is usually the case during periods of exceptionally dry summer weather in Oklahoma, daytime temperatures soared throughout the state. Triple-digit temperatures were observed somewhere in the state each day from the 2<sup>nd</sup> through the 31<sup>st</sup>. The state's average temperature for the month, 85.7 degrees, was 4.9 degrees greater than normal, ranking this as the 6<sup>th</sup> warmest August since 1892. The overall summer-month average temperature, suppressed by the cool June, was 80.5 degrees, only 0.5 degree above normal and the 47<sup>th</sup> warmest of the 109 summers on record. The average temperature of 64.1 degrees, 1.7 degrees greater than normal, over the year's first eight months, ranks this as the 17<sup>th</sup> warmest January-through-August observed in Oklahoma.

Only four stations reported daily precipitation totals of as much as one inch. Woodward (Woodward County) and Kenton (Cimarron) each broke the one-inch barrier twice. Woodward reported 1.23 inches on the 8<sup>th</sup> and 1.70 inches on the 10<sup>th</sup>. Kenton recorded the greatest daily rainfall amount of the month, a reported 1.80 inches on the 8<sup>th</sup>, in addition to a 1.22-inch total reported on the 18<sup>th</sup>. The other one-inch reports were 1.01 inch at Regnier (Cimarron) on the 9<sup>th</sup> and 1.07 inches at Tuskahoma (Pushmataha) on the 11<sup>th</sup>. No precipitation event greater than .25 inch was recorded in the state after the 19<sup>th</sup>. Kenton and Woodward were the only reporting stations to exceed their August normal precipitation and many stations did not report measurable precipitation.

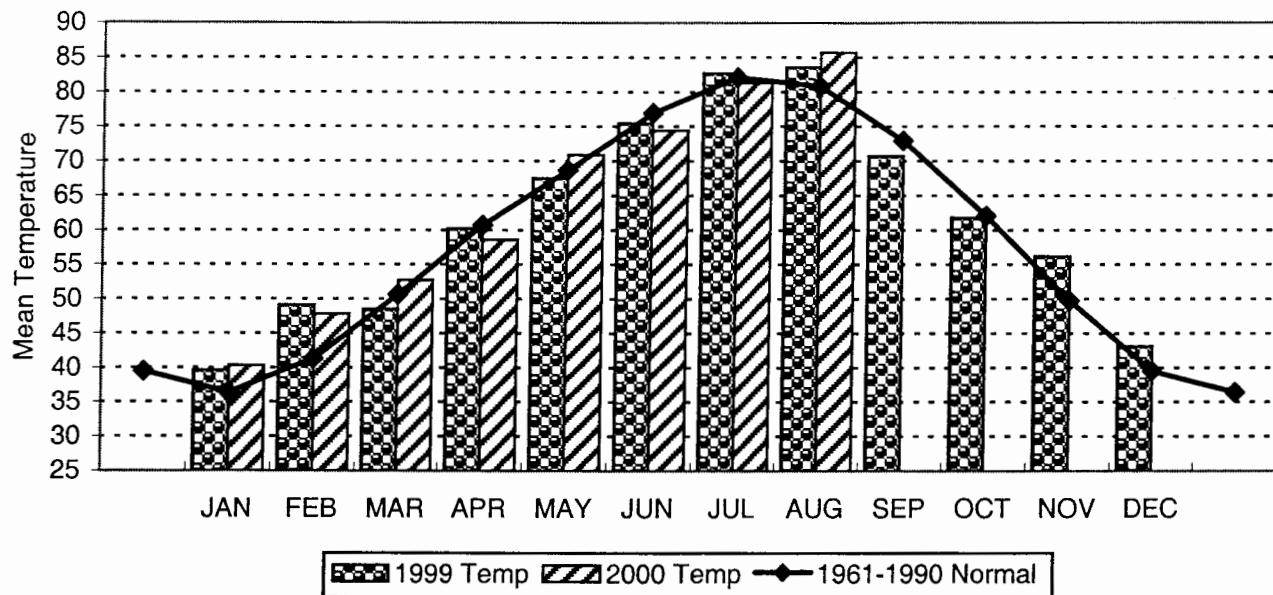

The cloudless days were hot. Daily maximum temperatures at three Mesonet stations (Grandfield in Tillman County, Walters in Cotton County, and Waurika in Jefferson County) topped 100 degrees each day from the 2<sup>nd</sup> through the 31<sup>st</sup>. The highest temperature reported during the month was 111 degrees at Buffalo (Harper), reported on the 26<sup>th</sup>. There were five other days during the month (4<sup>th</sup>, 13<sup>th</sup>, 27<sup>th</sup>, 28<sup>th</sup>, and 31<sup>st</sup>) when various National Weather Service observers around the state recorded 110-degree daily maximum temperatures. Two heat-related deaths were reported, both in the Oklahoma City metropolitan area late in the month.

Mesonet stations recorded peak winds in excess of 50 miles per hour on four days during the month. All four of the events were in the northwest and each was associated with a thunderstorm. The Woodward site recorded a wind of 75 miles per hour on the 7<sup>th</sup>, Goodwell (Texas) recorded 60 miles per hour on the 8<sup>th</sup>, and Kenton notched 51 miles per hour on the 9<sup>th</sup> and 63 on the 17<sup>th</sup>. Wind damage from thunderstorm-associated winds occurred at Quinton (Pittsburg) on the 23<sup>rd</sup>.

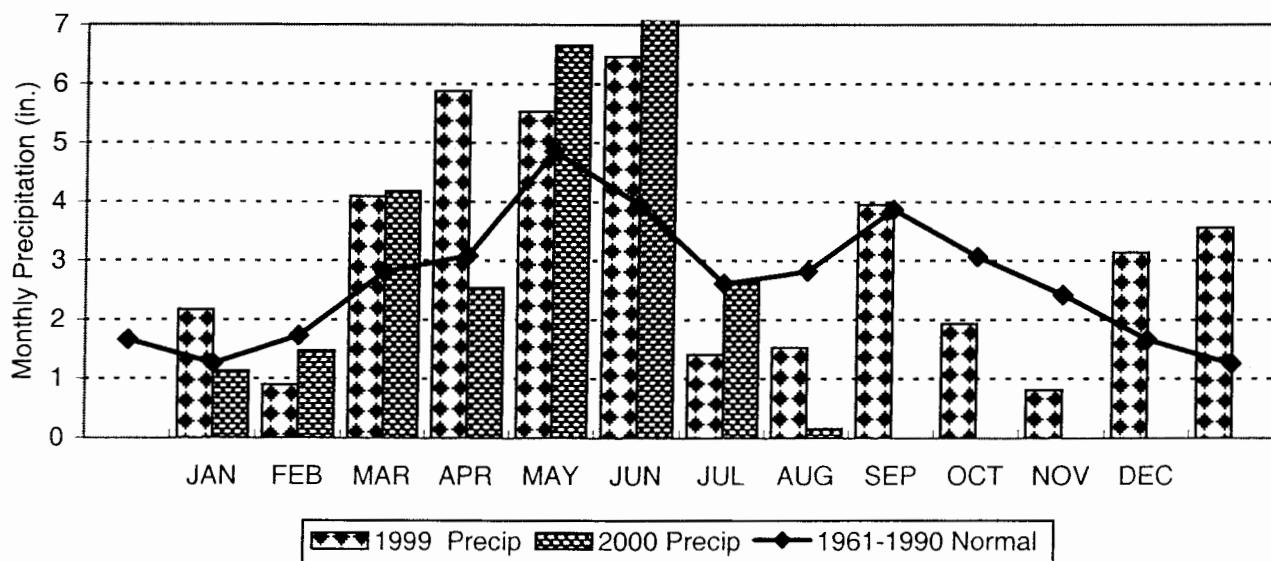

A burn-ban was implemented by the state for 15 counties in the southeast on the 18<sup>th</sup>. After a wildfire broke out near Binger (Caddo), the ban was extended to 71 counties (statewide save for 5 counties in the northeast and Cimarron County in the Panhandle) on the 23<sup>rd</sup>. The five northeastern counties were included in the ban, which remained in place at the end of the month, on the 29<sup>th</sup>. Near end of the month, the governor declared a drought emergency in several counties along the Red River in south central and southwestern Oklahoma.

Howard L. Johnson

- 5 – Central
- 6 – East Central
- 7 – Southwest
- 8 – South Central
- 9 – Southeast

### EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

#### Station Name:

**Station Identification Number:** These are usually assigned by the National Climatic Data Center.

**Climate Division:** See the figure above.

**Number of Temperature Observations:** These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

**Deviation from Normal:** The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

**Maximum Daily Maximum:** The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

**Minimum Daily Minimum:** The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

**Heating Degree Days:** HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 2000 HDD would be calculated as:

29

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

**Deviation from Normal Heating Degree Days:** A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

**Cooling Degree Days:** CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

30

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

**Deviation from Normal Cooling Degree Days:** A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

**Total Precipitation:** Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

**Number of Precipitation Observations:** The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

**Deviation from Normal Precipitation:** A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

**Maximum 24-Hour Report and Day:** The maximum amount of precipitation recorded during the station's 24 hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

**OKLAHOMA CITY CLIMATE CALENDAR**
